RT cell surface receptor CD23 and comparison of two independently

RT derived molecular models,";

RL PROTEIN SC1. 5:240-247(1996).

CC -1- FUNCTION: THIS RECEPTOR HAS ESSENTIAL ROLES IN THE REGULATION

CC OF IGE PRODUCTION AND IN THE DIFFERENTIATION OF B-CELLS (IT IS

CC A B-CELL-SPECIFIC ANTIGEN).

CC A SOLUBLE EXCRETED FORM.

CC A SOLUBLE EXCRETED FORM.

CC -1- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A (SHOWN HERE) AND B; ARE

CC PRODUCED BY ALTERNATIVE SPLICING.

CC -1- PTM: N- AND O-GLYCOSYLATED.

CC -1- PTM: N- AND O-GLYCOSYLATED.

CC INTROCELLANEOUS: THERE ARE TWO KINDS OF FC RECEPTORS ON LYMPHOCYTES

CC AND MONOCYTES.

CC AND MONOCYTES.

CC -1- SIMILARITY: CONTAINS 1 C-TYPE LECTIN FAMILY DOMAIN.

CC -1- DATABASE: NAME-PROW: NOTE-CD guide CD23 entry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         [6]

"The complete genome sequence of the lactic acid bacterium Lactococcus
lactis ssp. lactis IL1403.";

Genome Res. 11:731-753(2001).

-I-FUNCTION: SbcCD cleaves DNA hairpin structures. These structures
can inhibit DNA replication and are intermediates in certain DNA
recombination reactions. The complex acts as a 3'->5' double
strand exonuclease that can open hairpins. It also has a 5'

CATALYTIC ACTIVITY: (7E,9E,112,142)-(5S,6S)-5,6-epoxyicosa-7,9,11.14-tetraenoate + H(2)O = (6Z,8E,10E,14Z)-(5S,12R)-5,12-dihydroxyicosa-6,8,10,14-tetraenoate.

COFACTOR: BINDS 1 ZINC ION (BY SIMILARITY).

PATHWAY: Leukotrienes biosynthesis: third step.

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

SIMILARITY: BELONGS TO PEPTIDASE FAMILY M1.

P36267;
                      Biotechnol. Prog. 9:323-331(1993).

1 - CATALYTIC ACTIVITY: (5-L-glutamyl)-peptide + an amino acid peptide + 5-L-glutamyl-amino acid.

1 - PATHWAY: GGT PLAYS A KEY ROLE IN THE GAMMA-GLUTAMYL CYCLE, PATHWAY: FOR THE SYNTHESIS AND DEGRADATION OF GLUTATHIONE.

1 - SUBUNIT: THIS ENZYME CONSISTS OF TWO POLYPEPTIDE CHAINS, WINSTHESIZED IN PRECURSOR FORM FROM A SINGLE POLYPEPTIDE.

SYNTHESIZED IN PRECURSOR FORM FROM A SINGLE POLYPEPTIDE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. Biophys. Res. Commun. 193:787-793(1993).

1. FUNCTION: CONTROL OF TOPOLOGICAL STATES OF DNA BY
BREAKAGE AND SUBSEQUENT REJOINING OF DNA STRANDS.

MAKES DOUBLE-STRAND BREAKS.

1. CATALYTIC ACTIVITY: ATP-dependent breakage, passag
of double-stranded DNA.

1. SUBUNIT: HONODIMER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-NOV-1995 (Rel. 32, Created)

A;Reference number: A65963; PDB:1KJE
A;Reference number: A65963; PDB:1KJE
A;Contents: annotation; conformation by theoretical model, residues 173-285
C;Comment: The sequence of the splice form a is shown.
C;Comment: This receptor for the Fc portion of IgE is expressed in various hematopoletic ells.
C;Comment: Splice form a is expressed constitutively in B-cells; b is expressed in other C;Comment: Soluble IgE-binding factors are produced by proteolytic cleavage of IgE Fc re C;Genetics:
A;Gene: GDB:FCER2; FCE2

                                                                                                                                                                                                                                                                                                        A; Molecule type: protein
A; Residues: 24-49; L',51-63 <KAT>
C; Comment: Three types of PAI have been identified. PAI-1
may be the primary site of synthesis of plasma PAI.
C; Comment: This inhibitor acts as "bait" for tissue plasmi
                                                                                                                                                                                                                                                                                                                                                                                                                                  A; Molecule type: mRNA

                                                                                                                                                                                                       The cDNA encoding the present sequence, which contains human soluble CD23 isoform B, can be used for the large scale recombinant production of soluble CD23.

The specification states that the nucleotide sequences contained in figures 4a-b, 5a-b, 12a-12b and 13a-b are claimed, however this numbering scheme does not relate to the scheme used in the relevant sections of the specification.

In large quantities. The DNA encoding the protein is obtd. from, eg human B cells, human malignant B or T cells, human monocytes or human ensinophilic cells. RPMI 8866 cells may also be cultured to produce the mRNA. The IgE binding factor and Fc epsilon receptor binds IgE and can be used to enhance the prodn. of IgE from IgE producing cells. They can be used to treat allergies by eliminating excess blood IgE, and can also

 Human IgE binding factor related polypeptide
                      12-DEC-1990
                                                                                                                                                                                                                   Fe epsilon receptor binds IgE. It is expressed from cell line RPMI8866. It is expressed in large ants, and can be used to remove excess IgE from blood, and to detect and quantify IgE. This would allow the development of therapy and diagnosis of allergy.
                                                                                                                                                                                                                                                                                                                                              WPI;

Immunology 53, 197, 207, 783 (1984).

Amino acids between 1-133 starting from the N-terminal may be deleted. This is the membrane-anchoring sequence binding the polypeptide to the cytoplasmic membrane of the B-cells.

Alternatively amino acids between 110-130 or 250-321 may also be deleted. The peptide has IgE binding activity and is useful tor treating allergic conditions, e.g. as caused by antigens such as pollens, cat danders and house dust mites.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           preparing FCR. Preferred embodiments of the present invention are psfc-epsilon-R-1 (see AAN81516/P81175) and also AAP81172. At least a part of the cDNA SQ coding for the AMS 1 to 148 of the Fc-epsilon-R is replaced by a eucaryotic cDNA signal SQ e.g.an interleukin cDNA signal SQ e.g.by the BSF-2 signal SQ (see pBSF-2-L8-AAN81517/P81176). A suitable yeast expression vector is a plasmid contg. the yeast ADHI-promoter, a gene coding for the yeast mating factor alpha leader peptide (MF alpha leader SQ) a multicloning site and the yeast ADHI-terminator (see AAN81514/P81173). See also EP-258492.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The inventors claim a human low affinity Fc-epsilon-receptor (FCR) with an N-terminal cytoplasmic domain, a C-terminal extracellular domain and a mol.wt. of about 46kd. Also claimed are recombinant DNA conty, the genetic information for the FCR, vectors conty, the DNA, host organisms transformed with the vectors, oligonucleotides coding for partial amino acid sequences from FCR, and processes for
                                                                                                                                                                                                                                                                                                                                    Human lymphocyte receptor

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Whole human lymphocyte receptor for immunoglobulin (see corresp. AAN90344). Used to produce highly bioactive water-soluble FCR. Water-soluble FCR binds 1gE, so it is useful for treating hypersensitivity, esp. asthma. Amino acid residue 150 is a possible site for trypsin-like proteases.

    used for treatment or prophylaxis of local and
allergic reactions induced by IgE.

                                                                                                                                                                                               Cloned genes coding for soluble IgE receptor - coding sequence of Fc epsilon receptor gene.

Peptide
                                                                                                                    Human; soluble; CD23; complementarity isoform A; recombinant production.
                                                                                                                                                                                                                                                                                                                                                             The sequence is of IgE-binding factor, secreted from the plasmid pSVG-BF. The plasmid pSVG-BF is a derivative of plasmid pSVG-ER which has the sequence coding amino acids 1-147 replaced with a coding region (AAQS5400) allowing secretion of the factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant DNA molecule - comprises enhancer and promoter unit linked to transcriptive DNA segment and DNA segment comprising promoter unit linked to DNA sub-segment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Key

                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of 973 human testicular antigens, and fragments of their genomic sequences. The sequences can be used in the treatment of cardiovascular, urinary system, reproductive system, immune, respiratory, neurological and gastrointestinal disorders, infections, and particularly cancer, especially testicular cancers. The present sequence is a protein of the
                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding 973 human testicular antigen polypeptides, useful for preventing, diagnosing and/or treating testicular cancer
                                                                                                                                                                              Sequence
